Dual-Engine Mobility Platform - Pitch Deck Outline

The Problem

- Corporate tech parks suffer from severe congestion and expensive parking real estate limits.
- Employees face high commuting costs with commercial ride-hailing and unreliability with peer-to-peer carpooling.
- Result: Wasted facility space, high carbon footprints, and commute fatigue.

The Solution

- A dual-engine mobility ecosystem combining community trust with commercial reliability.
- Peer-to-peer cost-sharing for daily commutes, backed by on-demand commercial rides to guarantee no one is ever stranded.

Engine 1 (Community Carpool)

- Verified employees schedule routes and split exact fuel/toll costs.
- Closed-loop matching ensures safety (e.g., verified tech park employees only ride with other verified peers).
- 100% compliant with non-profit cost-sharing transit laws for white labeled number tags.

Engine 2 (Commercial Backup)

- Integrated commercial cabs and bikes for instant dispatch.
- Eliminates "carpool anxiety." If a coworker cancels.
- Keeps the user within our ecosystem, retaining transaction value and brand loyalty.
- Much more user-friendly for on-the-spot commuting situations.

Value Proposition for Corporate Partners

- Parking Optimization: Every successful carpool frees up 1-2 premium parking spots, directly reducing facility overhead.
- ESG Compliance: Delivers measurable reduction in carbon emissions for corporate sustainability reports.
- Employee Wellbeing: Reduces commute friction and encourages cross-department networking.
- Better intra-departmental synergy: Commutes build better synergy between the members of the company

Go-To-Market Strategy

- Phase 1: Localized launch within a single dense tech hub. Leverage HR partnerships for closed-network verification.
- Phase 2: Introduce Engine 2 (commercial rides) to monetize the highly engaged daily user base.

The Ask

- A zero-risk, 30-day closed-beta pilot for your campus.
- Opportunity to run a digital traffic simulation to demonstrate projected parking and congestion relief based on actual employee density.
- Open to discussions on further implementations of this infrastructure into your community.
